Motivation

- A 'growth mindset' is the belief that abilities can grow (Dweck and Yeager 2019).
- The literature is well-established in showing the impact of **student mindset interventions** on their **school achievement** (Blackwell et al., 2007; Yeager et al. 2019).
- There is a growing body of research showing the importance of **teacher mindsets** to sustain student growth mindsets (Yeager et al., 2022; OECD, 2021).
- However, little is known about:
 - Effective interventions to improve teachers' mindset.
 - The effects of teachers' growth mindset on pedagogical practices and student learning.
- The literature is also scarce on the impact of mindset interventions in contexts of social vulnerability.

< □ > < 同 > < 回 > < 回 > < 回 >

Research questions

- What is the effect of a teacher mindset intervention on teachers' growth mindset?
 - Did our mindset intervention affect teachers' mindsets?

I How does a teacher's growth mindset impact <u>student outcomes</u>?

- Did our intervention improve student outcomes in Mathematics and Language?
- Did the increase in teacher growth mindset due to our intervention improve student outcomes in Mathematics and Language?

Results

- Results indicate robust evidence that teachers can change their mindset even in a socially vulnerable context.
- Teachers' growth mindset has a positive and significant effect on student learning.
 - Higher impact on student results in Mathematics.

∃ ► < ∃ ►</p>

Randomized Controlled Trial: Intervention

Mindset workshops for 5th-grade teachers in Rio de Janeiro public schools:

- Five two-hour meetings: March and April 2019
- 125 teachers in 8 classes: 2 teacher trainers (1 per class)
- Pilot in 2018: Focal groups; Questionnaires

Content: How to develop a growth mindset classroom

- Fixed and Growth mindset; The brain as a muscle; Dealing with mistakes and frustration; Mindset "trap"; Stereotype threats; Creating a safe learning environment
- Homework: Activities with their students and exchange of experiences among teachers

Randomized Controlled Trial: Intervention

Randomized Controlled Trial: Sample

- 395 schools invited.
 - Schools with 1 or 2 5th grade classrooms (both teachers have agreed to participate).
- 252 schools came to meeting.
- 178 enrolled to participate = 324 5th grade teachers.
 - 50 percent treatment = 89 schools
 - 50 percent treatment = 89 schools
- 152 schools with complete data: 26 schools did not allow classroom observations and/or questionnaire application.
- 273 teachers answered questionnaires; 271 classroom observations.
 AEA RCT Registry.

Randomized Controlled Trial: Sample

Data Collection: Instruments

Teachers' questionnaires:

- Mindset: Implicit Theory of Intelligence (Dweck 2000); Implicit Theory of Intelligence Scale (ITIS) (Abd-El-Fattah and Yates, 2006); Confidence in One's Intelligence (Dweck, 2000).
- Social desirability: Marlowe-Crowne Social Desirability Scale Items (Reynolds, 1982)
 - Translated by two separate translators; Focal groups to discuss language and context; Tested in pilot group.

Student achievement:

• SAEB 2019

1 month of data collection: Oct 29 to Nov 29/2019

Estimations: Teachers' Growth Mindset

- What is the effect of a teacher mindset intervention on teachers' growth mindset?
 - Did our mindset intervention affect teachers' mindsets?

Cruz, Tassia

Conclusion

- Results indicate robust evidence that teachers had increased growth mindset after participating in workshops.
- Students in classes where teachers participated in growth mindset workshops had a significant improvement in Math test scores (0.3 sd), but no significant change in Language scores.
- Students whose teachers have higher growth mindset had a significant increase in Math test scores, but also no significant change in Language scores.
- There is evidence that the one of the possible mechanisms to explain such significant changes in learning is the observed improvement in pedagogical practices, particularly in classroom culture and quality of instruction (measured by TEACH+ methodology).

Looking forward

- In 2021, we did a follow-up intervention with the following goals:
 - Evaluate the long-term effects of the mindset.
 - Evaluate different formats of delivering the workshop: online and synchronous format, allowing easier expansion to the school network.
 - Focus the content of the workshops to improving racial equity in educational outcomes.
